

Complementary Guidelines

Complementary Design Guidelines

This document gathers a series of additional recommendations, tips, and best practices that we have developed over time while working with the BioMar brand. These are not official brand guidelines, but rather practical notes intended to help maintain consistency, improve efficiency, and avoid some of the common issues we've encountered in day-to-day projects.

Use these guidelines as a complement to the Brand Book and existing templates whenever relevant. As always, every project is different, so apply your own judgment and adapt these recommendations to each specific case.

The following colours have previously been used in approved BioMar materials and may be considered when relevant.

Colours used in GSRs or Our Blue Journey

Colours used in Packaging

Other colours used in other material

BioMar Alternative Colours

All approved BioMar colours can be found in the **BioMar Product Brand Guidelines** and should always be the primary reference when selecting colours for a project.

However, over time, a few additional colours have been developed and approved for specific projects or communication materials. While these are not part of the core colour palette, they can be used when appropriate to complement the existing brand colours and provide greater flexibility, provided they remain consistent with the BioMar visual identity.

Sustainable Feed Solutions for Atlantic Salmon

Our latest feeding strategy helps improve fish performance while supporting more sustainable aquaculture practices.

Better Feed. Better Fish. Better Food.

BioMar continues to develop innovative feed solutions that contribute to a more sustainable value chain.

Capitalization

- Use **Title Case** for titles, headings, and short text elements such as graph titles, chart labels, and infographic headings. This creates a cleaner, more consistent look across communication materials and improves readability.
- For longer copy, body text, captions, and paragraphs, use **sentence case** unless there is a specific reason to follow another style (e.g. official product names or trademarks).
- If you have any doubts, please check the [Brand Voice Guidelines](#)

✓ Do

✗ Don't

Avoid the Use of Gradients

As a general rule, avoid using gradients in design concepts, communication materials, and packaging.

There are two main reasons for this:

- **Brand consistency:** BioMar's visual identity is built around clean, simple, Scandinavian-inspired design. Solid colours reinforce this aesthetic, while gradients often introduce a more decorative look that does not align with the brand.
- **Print production:** Gradients can be difficult to reproduce consistently in print, especially on packaging. Achieving a smooth gradient often requires specialized printing equipment or suppliers, increasing production complexity, costs, and the risk of inconsistent results.

Whenever possible, use solid colours, colour blocks, or overlays instead of gradients to achieve depth and visual hierarchy while maintaining brand consistency and print quality.

Avoid the Use of Gradients

Note: Black to Transparent Gradient

In some cases, a **black-to-transparent gradient** can be used with a **Multiply effect** to improve text readability when placed over images or complex backgrounds.

However, this gradient should only be considered a supporting tool to create contrast and improve legibility — it should not become the main design element or a visual style on its own.

The purpose is to enhance communication while keeping the overall design clean and aligned with the BioMar visual identity.

BioMar Wave

- The **BioMar Wave** is a visual element used across different materials to add more movement, depth, and visual interest to our designs.
- Especially in communication materials, the wave helps reinforce BioMar's more **friendly, organic, and approachable look and feel**, while creating a stronger connection to our brand identity and the natural environment we are part of.
- When using the wave, aim to keep it simple and balanced, ensuring it supports the content rather than becoming the main focus of the design.

Website Bags vs. Real Bags

Website Bags

Website bags are created exclusively for digital use and follow a specific structure designed to provide consistency across the website experience. They are not a direct representation of physical packaging. Each website bag includes two main elements:

- **Colour coding:** The colour indicates the product category or segmentation the product belongs to, helping users quickly understand the product range.
- **Life stage wheel:** The life stage wheel communicates the target species stage and supports easier navigation through the product portfolio.

When creating or updating website bags, always follow the established digital structure rather than adapting physical bag designs directly.

Generic Bag

Custom-made bags

Website Bags vs. Real Bags

Real Bags

Real bags refer to the physical packaging used for products in the market. These can be divided into two main categories:

- **BioMar standard bags:** These follow the established global packaging structure and visual identity, ensuring consistency across markets.
- **Custom-made bags:** These are developed for specific markets or customer requirements when there is a particular need or request. While these designs can have adaptations, they should always remain aligned with the BioMar brand identity and existing packaging principles.

When creating or reviewing physical packaging, always consider previous bag developments to ensure consistency and alignment with the overall product portfolio.

Packaging Consistency

- In recent packaging developments, we have followed the approach of keeping the top area of the bag in **BioMar Blue** with the **secondary white BioMar logo**. This ensures that the BioMar brand is the first element people recognize when seeing the product.
- There can be exceptions depending on market requirements, product positioning, or specific project needs. However, the overall goal is to maintain consistency across our packaging portfolio and strengthen brand recognition.
- Before creating a new packaging design, always review existing bags and packaging examples to understand the current visual direction and ensure alignment with previous developments.

Exceptions

Requested to have BioMar Blue on the bottom

Requested to be differentiated from EXIA packaging

Requested to have a different visual from the general EFICO bag, as this is Functional Feed

Considerations for Custom Packaging Design

When creating a custom bag for a specific market, the design should remain consistent with the overall BioMar packaging portfolio while addressing local requirements. Keep the following principles in mind:

- **Stay aligned with existing packaging.**
New designs should follow the current BioMar packaging direction. Always review existing bags before starting a new concept to ensure visual consistency across the portfolio.
- **Use approved colours whenever possible.**
Colours should come from the approved BioMar colour palette. If none of the existing colours are suitable, any new colour must be approved by **Global Marketing** and the **Product Manager** before implementation.
- **Keep BioMar Blue as the dominant colour.**
BioMar Blue should remain the primary colour on the bag to reinforce brand recognition and maintain consistency across products.
- **Avoid red.**
Red is a prohibited colour, as it is strongly associated with a main competitor. The only exception is **medical feed**, where certain markets require the use of red due to local regulations or industry standards.
- **Keep the design clean and timeless.**
Follow BioMar's Scandinavian-inspired design approach by avoiding unnecessary decorative elements. Aim for a clean, modern layout that prioritizes clarity, simplicity, and longevity over trends.

Icon Style

- The icon style is not yet formally defined in the current BioMar Brand Guidelines. However, to maintain consistency across materials, BioMar icons should follow a simple and clean visual approach.
- Use **one-coloured filled icons** as the preferred style. Filled icons create a stronger visual presence and align better with BioMar's clean, Scandinavian-inspired design language.
- Avoid using **stroke icons**, as they can feel lighter and less consistent with the overall brand expression.

Our Blue Journey Booklet

- The **Our Blue Journey booklet** is created to showcase BioMar's milestones and progress towards our **Our Promise sustainability goals**. Over the years, this publication has allowed for more creative exploration compared to other corporate materials, giving each edition the opportunity to develop its own visual direction while remaining connected to the BioMar brand.
- The design should always be rooted in the **corporate colour palette**, while allowing room to introduce complementary colours when relevant. Previous design directions can be reviewed in the folder:
Sustainability > 1. Sustainability Report
- When creating a new edition, the starting point should be identifying a **guiding theme** connected to the most important topics, achievements, or focus areas from that year. This theme then becomes the foundation for the visual concept and helps create a unique story throughout the booklet.

2025

2024

Our Blue Journey Booklet

Examples of Previous Design Directions

2025 – Partnership Design direction: “The Impact Line”

The theme of partnership focused on the connections created throughout our value chain. The design concept used a continuous line as a visual metaphor for collaboration, showing how different actions, people, and initiatives are connected to create a larger impact.

2024 – Better Nutrition Design direction: “The Bigger the Better”

The theme focused on the importance of nutrition and its role in creating better outcomes. The design direction highlighted key information through large-scale numbers, impactful data visualisation, and prominent graphs, making the sustainability achievements easier to understand and more engaging.

Each edition should feel unique and relevant to the year it represents, while maintaining a clear connection to BioMar’s visual identity and sustainability story.

Fonts for Non-Latin Languages

When working with non-Latin languages, use the following font alternatives to ensure readability, consistency, and proper character support while maintaining the closest possible alignment with the BioMar visual identity.

- **Chinese:** Noto Sans CJK SC
- **Vietnamese:** Arial
- **Greek:** Arial
- **Turkish:** Avenir Next
- **Russian:** Arial

Always ensure that the selected font supports all required characters and maintains a clean, professional appearance across different applications and formats.

Other Fonts We've Used

Throughout the years, we have used multiple fonts for specific projects where a different visual expression was needed. Using alternative fonts is allowed **when there is a clear design justification**, such as reinforcing a project's concept or adapting to a specific communication.

For example, seasonal materials (e.g. Christmas) may use a more festive typeface, while publications such as the **Sustainability Report** or **Our Blue Journey** can introduce complementary fonts that support that year's design direction.

Any alternative font should always be selected intentionally and approved by **Global Marketing** to ensure it remains aligned with the BioMar Brand.

Coastline

Coastline is one of the few alternative fonts that continues to be used. It was first introduced in a campaign and has since been incorporated into selected campaigns and social media posts to add a warmer, more human touch.

Use Coastline sparingly, primarily for short headlines or accent text, where a more approachable and personal tone is desired. It should complement the primary typography, not replace it.

For the website due to license, we use Montserrat for Titles. For more info, check Website Font Guidelines.

Product Bags in Social Media

- Avoid relying too heavily on product bag mockups in social media content. While they can be useful when introducing a new product or supporting a product-focused announcement, they should not become the default visual resource.
- Our goal is to communicate the **benefits, value, and story** behind the product, rather than simply showcasing its packaging. Whenever possible, use imagery, illustrations, or concepts that help explain the product's purpose, application, or impact, creating content that is more engaging and visually appealing.
- Product bags should support the message, not be the message itself. A concept-driven visual approach is generally more effective at capturing attention, encouraging interaction, and reinforcing the BioMar brand in a modern and premium way.
- **Tip:** *Ask yourself: "Could this post work without showing the bag?" If the answer is yes, consider leading with the concept instead and use the bag only when it adds value.*
