Fish

LARVIVA®

Start Strong. Stay Strong.

LARVIVA is a complete range of hatchery feeds. It is specially developed to maximize the success of the hatchery operations by giving your larvae a strong start ensuring high quality, robust and performing fry ready for the grow out stages.

The hatchery range includes premium and standard programs for larval/post-weaning, and nursery stages to fit the goals and protocols of the different hatcheries. High quality broodstock feeds for both maintenance and maturation periods and an enrichment diet for rotifers and Artemia, complete the range.

Shrimp

LARVIVA®

Start Strong. Stay Strong.

The LARVIVA hatchery range for shrimp offers a complete selection of top-quality products specially formulated to support the demanding nutritional needs of fast-growing larvae and post larvae.

Our sophisticated production technology allows for optimal nutrient availability and the inclusion of proven effective additives ensures robust post larvae in shorter production cycles.

Health concept

You care. We care.

SmartCare

SmartCare is a range of preventative health feed products that meet many of the challenges experienced in aquaculture.

Through the use of biofunctional ingredients and adapted nutrition, it is possible to reduce health issues while simultaneously focusing on the growth of the fish.

You care. We care. SmartCare

The SmartCare range is a supplementary feed programme that can address many of the challenges fish experience in aquaculture today. By using functional ingredients and adapted nutrition, we can help you give your fish the optimal nutrition at the most relevant time.

YOU CARE. WE CARE.
SmartCare®

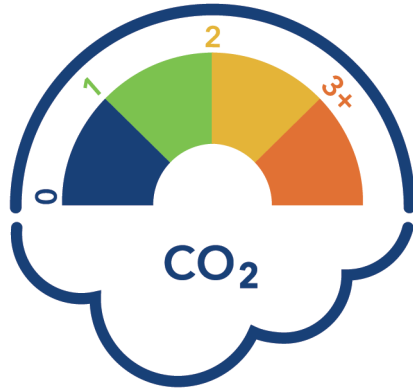

Progressively Transforming Aquaculture

Aquaculture feeds count for around 80% of the environmental footprint of aquaculture farming. As we continue to innovate towards a sustainable future, we must reduce our dependency on scarce marine ingredients while selecting raw materials that are circular and restorative in nature and have a low carbon footprint.

Our Blue Impact feed range acts as a catalyst for driving change as we use applied, science-based sustainability to select ingredients that have a lower impact on our planet. New ingredients that are nutrient-dense but don't compete with food for human consumption will be first brought to market in our Blue Impact diets.

Impact Parameters

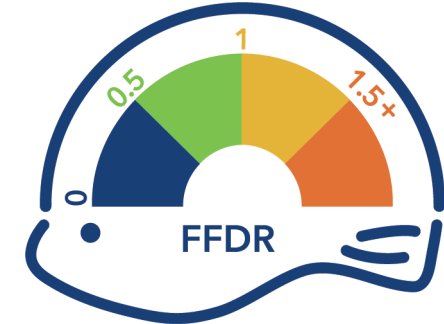

Carbon Footprint

Climate change caused by Greenhouse Gas Emissions (GHGs) is one of the biggest threats to the planet and its inhabitants. Carbon footprint is a measure of the cumulative GHG emissions from the lifecycle of a product or service expressed in CO₂ equivalents.

Circular & Restorative

Global food production is currently operating beyond planetary boundaries for a sustainable future. Aquafeed should therefore be decoupled from environmental degradation and direct competition with human food production. This indicator shows the percentage of circular and restorative ingredients.

Forage Fish Dependency Ratio (FFDR)

Marine ingredients are limited resources that should be used responsibly. The FFDR is a measure of forage fish equivalents utilise to produce one unit of farmed seafood.

**Blue Impact is
for meeting climate goals**
The blue journey

RAS

ORBIT

Specialised feed for advanced aquaculture technology

ORBIT is a range of aquaculture feeds designed for advanced farming technologies, like recirculating aquaculture systems (RAS), and aims to maximise the performance of both fish and the biofilters.

ORBIT is ideal for intensive farming systems or in farms where reduction or greater stability of faeces is required.

LARVIVA[®] ORBIT

A game changer for marine nurseries

LARVIVA ORBIT is the innovative feed concept specially designed for marine nurseries operating on RAS.

All ORBIT feed formulas are optimised using BioMar's state-of-the-art raw material evaluation methodology, in order to select the optimal raw material composition to ensure maximum faecal stability, providing the lowest possible impact on the RAS unit, without affecting the performance.

LARVIVA ORBIT is the solution for maximising efficiency, performance and profitability of marine nurseries.

Shrimp

BioMar Shrimp feed range

Performance driven feeds for shrimp, designed to provide optimal nutrition from larval stage to harvest.

A full range of top quality feeds and intelligent nutrition to help shrimp farmers achieve the best possible economic results according to their environment and farming conditions.

Cleaner Fish

Symbio

Balanced nutrition for cleaner fish

Cleaner fish are a highly valued partner of fish farmers as they gently and continually de-louses salmon. Careful management of a complete nutritional diet is critical for the balance and wellbeing of this cherished fish, ensuring it can perform at its very best.

BioMar's Symbio range prioritises fundamentally strong, species-specific nutrition. Covering the feeding needs of all relevant cleaner fish species, both in onshore production and as lice-eaters in the sea.

Your valued fish partner deserves the best!

Growth concept

THE P 3.0 CONCEPT

Next generation of aquafeeds

What do you feed your fish when fish prices are high or when you need to keep production costs low?

The P 3.0 CONCEPT ensures that fish farmers always get the performance they aim for, since BioMar feeds are carefully optimised for different types of fish products and according to various market situations.

Growth concept

Best Total Economic Performance

Our strong focus on performance delivers the Best Total Economic Performance to fish farmers by:

- Helping farmers achieve the best possible results on their fish farms, according to their farming conditions and objectives.
- Providing excellent fish feed quality which matches the nutritional requirements of the fish in each growth stage.
- Ensuring consistent and stable production results.

Quality concept

BioRhythmic Nutrition

Our BioRhythmic feeding concept helps to achieve the best possible production results when growth rate, feed conversion rate and survival are very important parts of the picture.

Utilizing the results from thorough research trials in our R&D centres, BioMar's international team of product developers can efficiently match the dietary needs of the fish at each individual growth stage and every pellet size is adjusted to match these requirements for each fish species.

For example, as fish size increase, they require less protein in their feed and BioMar optimizes the feed accordingly.
