Our Values

Our values are an enduring summation of what we stand for. They form the 4 elements of our Brand House.

1. Collaboration
2. Innovation
3. Sustainability
4. Performance

We have provided a style guide to help visually display the meaning behind our values and how we live our purpose.

1. Collaboration
We understand the power of mutually beneficial partnerships and we actively seek collaboration across all aspects of the industry.

2. Sustainability
We embrace a social responsibility to develop sustainable aquaculture. We strive to reduce our own environmental footprint and work with customers to improve the sustainability of their activities. We actively control our own supply chain.

3. Innovation
In collaboration with others we act as a catalyst for change. We support the cross-utilisation of knowledge - both internally and externally.

4. Performance
We work to ensure our customers have access to the most efficient and responsible feeding practices and we optimise our value chain.

Collaboration

Focus

To show collaboration, we showcase images that focus on how we act in partnership across all aspects of the industry.

It is important to show images that display equality and avoid images where one party is more dominant.

The hero of the image must remain the product, as this shows partnership in action.

When showing collaboration with a focus on people, they should be actively engaged in their work environment.

Innovation

Focus

Innovation images should focus on research & development and product production and innovation.

If using pictures of the production - aim to use dynamic shots with a sense of life and movement.

Seek to use clean, sharp images with a professional and scientific outlook. Avoid messy, gory or dirty images.

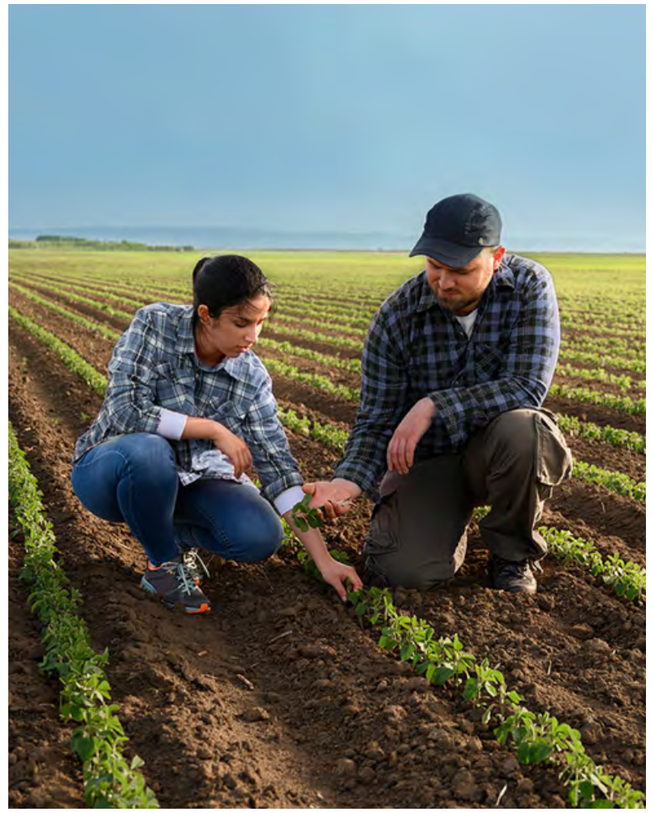

Sustainability

Focus

It is more important than ever to embrace our social and environmental responsibilities.

We look for images that show fresh and clean produce that may be growing in their natural environment. Try to use images that reflect the normal daily environment including images of farmers and workers.

Other images include local communities from around our BioMar operations up and down the value chain.

Performance

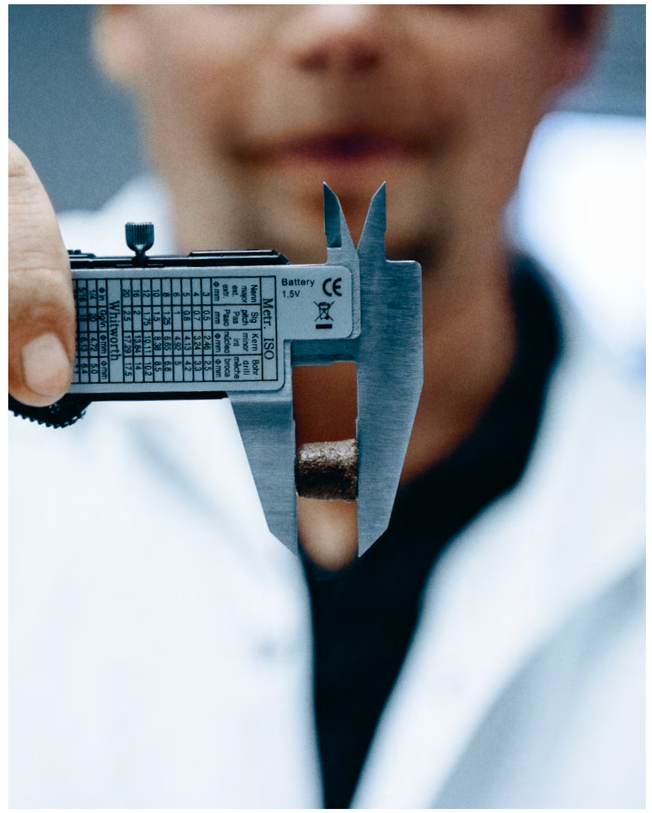

Focus

When focusing on performance we must show the high quality nature of our aquaculture feeds.

Look to show on-farm performance and feed formulation development.

Displaying our product in an engaging way can be challenging. Aim to show on farm action, engaging scientific testing etc.

Try to avoid using imagery with static pellets, instead show them in use, for instance in the water feeding the fish.

Water

Water connects every aspect of the BioMar Brand, regardless of species. This should be reflected in our visual style, either through photographs, images or the colour blue.

Focus
We expect the water images to show calm water with minimal scenery and be location neutral to appeal to all markets.

We want to utilise the use of clear, calm but inspiring, under and above water scenes.

Avoid using imagery with crashing waves and stormy seas.

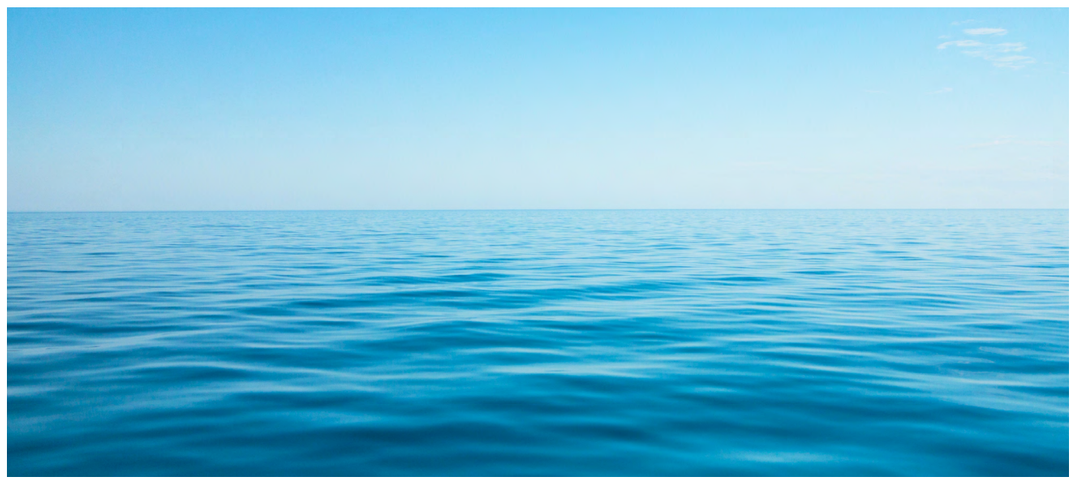

Photo Style Guide

Animal Welfare

Focus
It is vital to be mindful and respectful of the way we handle fish and shrimp. Photos that show them in a caring and respectful manner is more desirable over showing them cut up, damaged or broken.

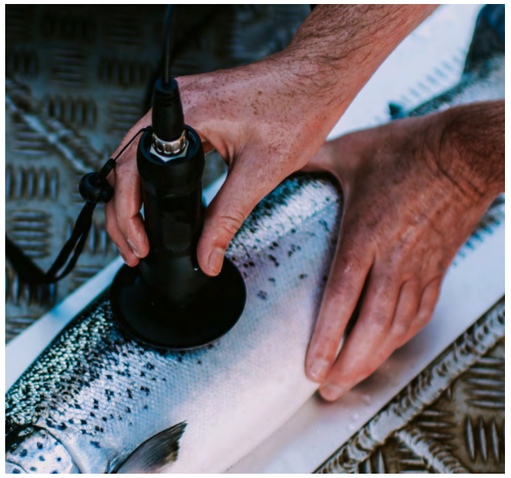

It is most important to show careful and delicate handling of the fish and shrimp.

Avoid showing fish and shrimp in a hunting or trophy like manner. It is difficult for them to appear live and well in photos.

It helps to incorporate water movement, this could be from ripples or water droplets.

End Product

Focus
Seafood is a healthy and tasty product and we should remind ourselves and our farmers of the benefits of all our hard work. That is why we incorporate images of the end product.

Images should display the seafood as the ‘hero’ and must be inspirational or show delight and enjoyment while having a friendly edge.

It is vital to consider appetite appeal. Sometimes a raw image can be more appealing than a cooked one.

We want to emphasize images that celebrate seafood. However be mindful of food safety elements and show clean and tidy work spaces.

Photo Style Guide

Responsible Sourcing

Focus
When using photographs of raw materials we want to focus on showing fresh, healthy ingredients in their natural environment.

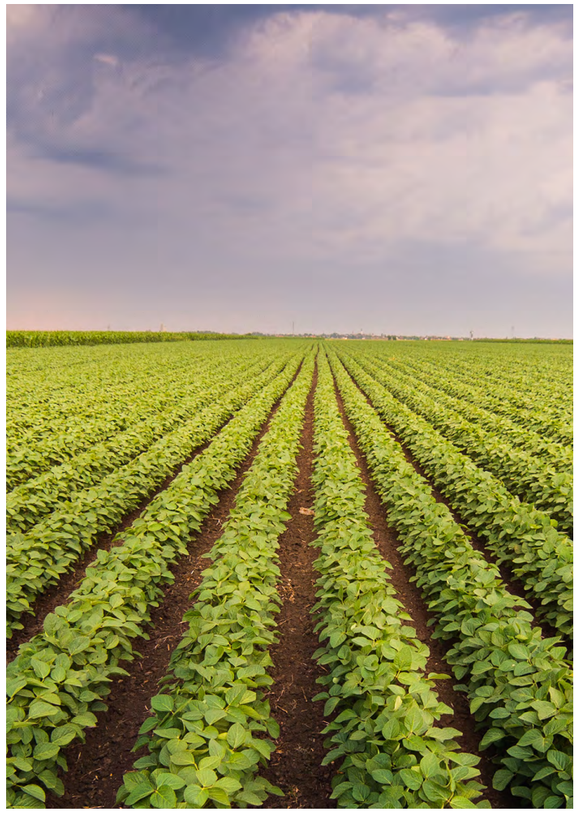

Only show images of the ingredients within our feed recipes.

Try to avoid using images of damaged or bloody ingredients as well as powders and nondescript oils. Instead try to show the original source of the raw material as this helps with a positive connection.

Consider incorporating the farmer or workers to build a more emotional response, but be mindful of human rights and our Code of Conduct.

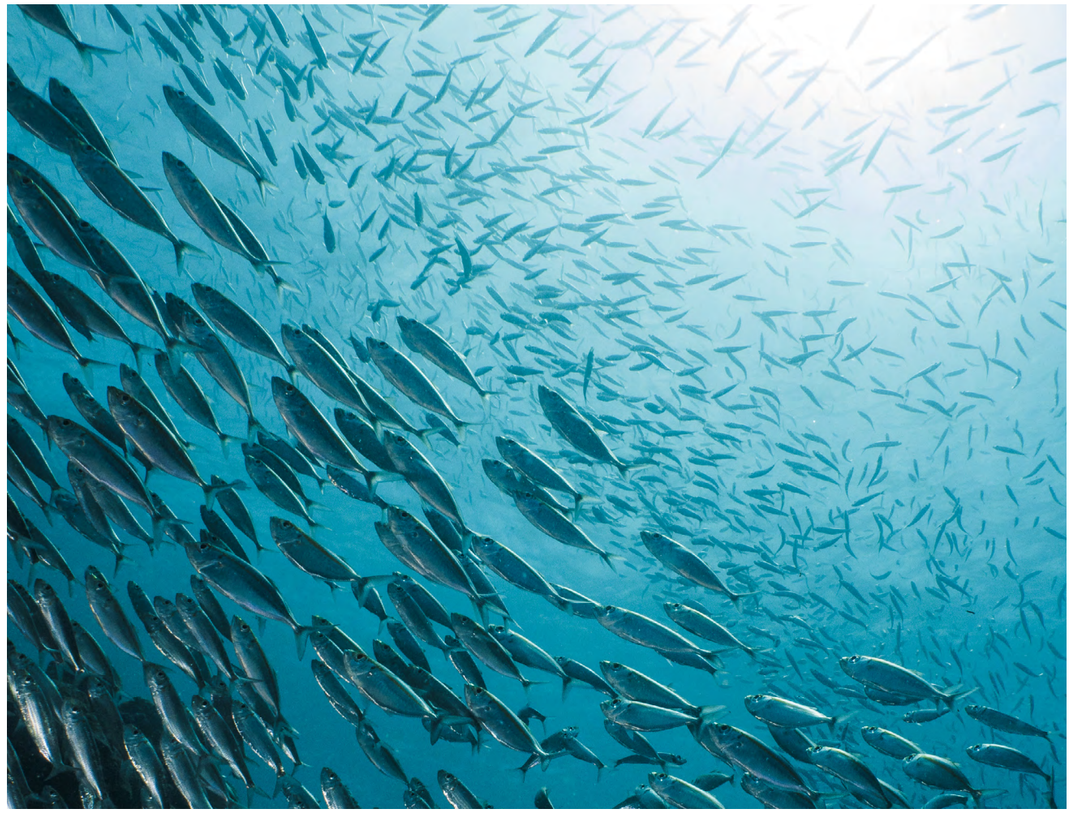

Photo Style Guide

People

Focus
When displaying photos of people we try to use employees or customers in their everyday work environment.

Ensure BioMar employees are wearing branded clothing and positioned in a way where the logo is visable.

It is important to show people as professional and approachable. Ensure that the proper and relevant safety gear is worn. E.g. Lifejackets, safety glasses, dust masks etc.

Avoid overly friendly or cliche gestures like handshakes and hugs.

Remember BioMar seeks GDPR approval across all markets even though it is only a legal requirement within Europe.

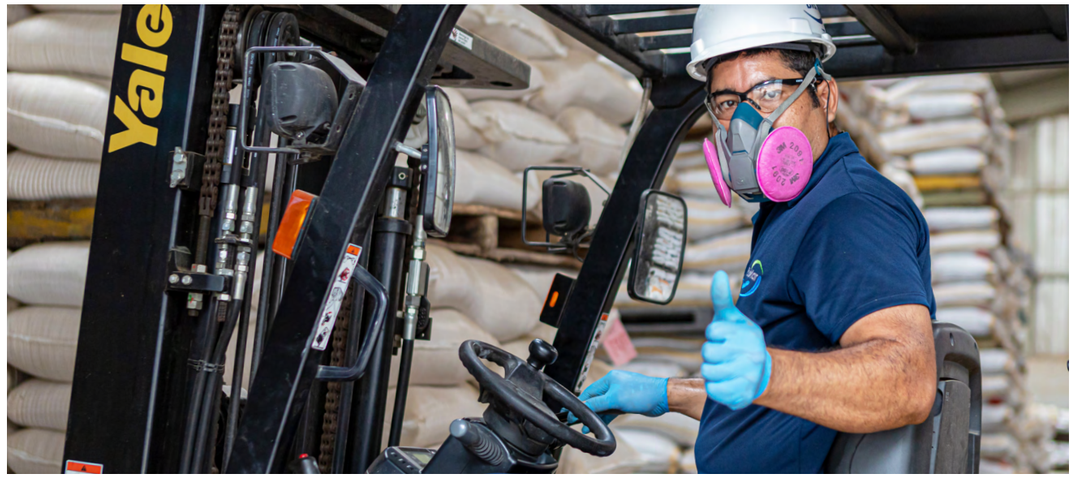

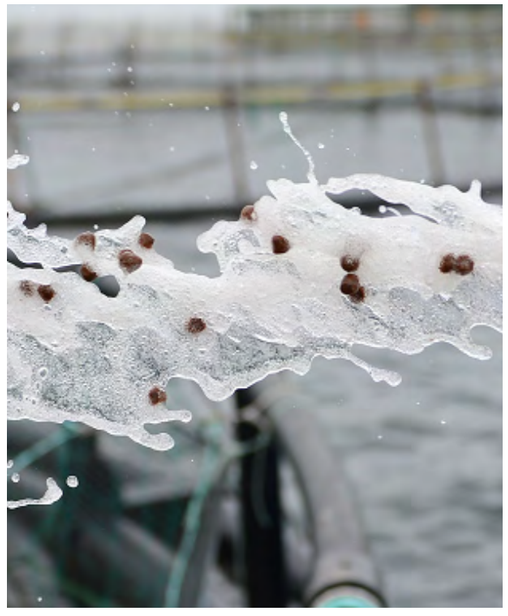

Photo Style Guide

Product Photography

Focus
It is important to show our product in live action rather than static whether it is in the lab, in production or out on the farm.

Aim for interesting, engaging and dynamic shots with a focus on the feed. Images with a sense of movement are much more appealing than a static/stationary image. For example; pumping the feed out vs showing a handful of pellets.

Whenever possible, we should try to add the value of collaboration, such as the farmers and BioFarm personnel working together with the feed on location.

Photo Style Guide

General Picture Look

Focus
As we use a lot of different photos from all over the world, by various photographers, we want the look of the images we produce to be as similar as possible.

For a sucessful image and to achieve a more uniform look and feel across all our images, it is important to create some contrast and ensure that the shots are slightly desaturated.

If in doubt, reach out to Global Marketing for further guidence and retouching.

Example: (shown above)

No contrast in image, no balance of light and dark.

Image is too vibrant.

There is no tone in the sky due to over exposure.

Image has good contrast which creates depth.

Desaturation helps to give the life vest, bucket and skin tone better balance and harmony.

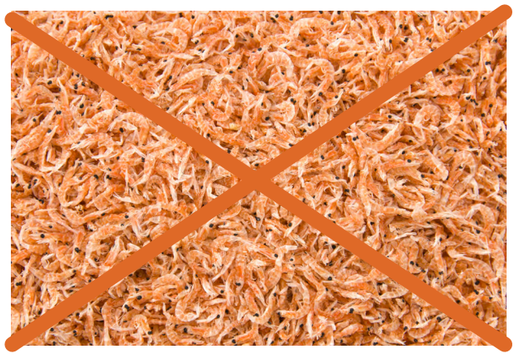

With proper exposure, the clouds can be seen in the sky, which gives a more realistic look.

Overall, the photo has more detail and is easier on the eye by desaturating and good contrast.

Dos and Don'ts

Zoom in on the elements. This makes the motive more interesting.

If you have limited space, don't use images with lots of details.

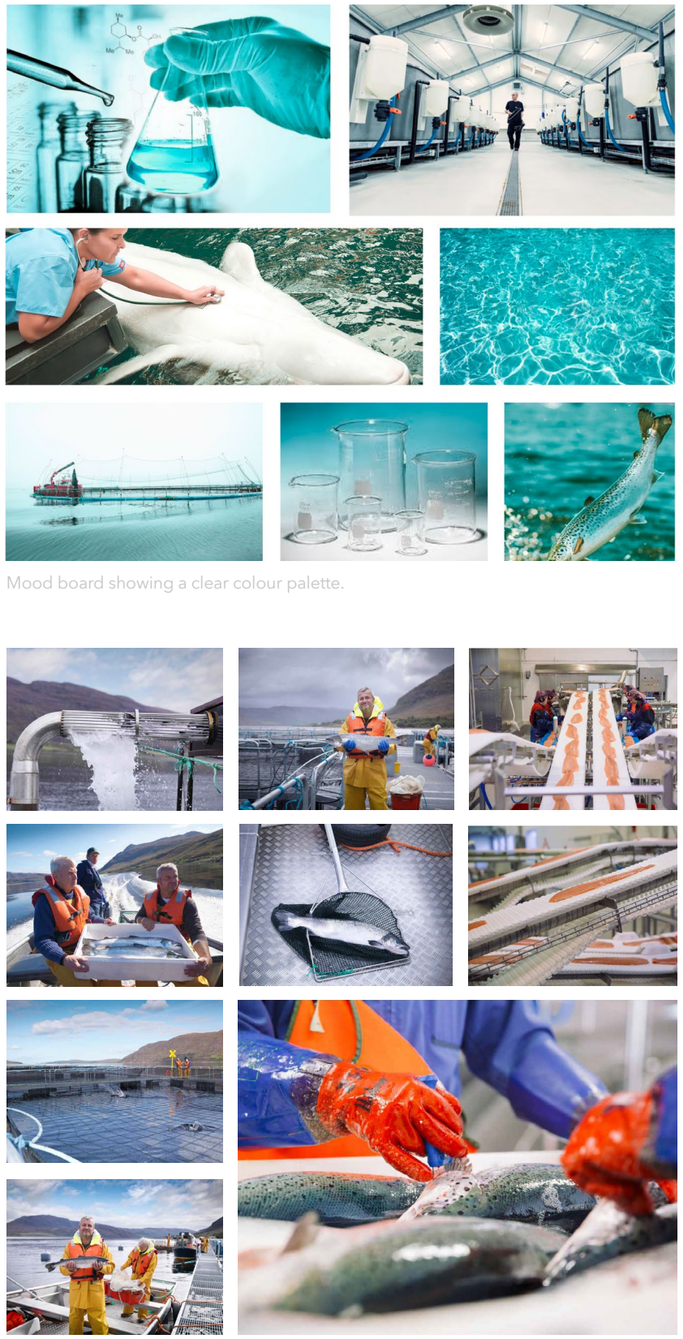

The rapeseed (right) is too vibrant and lacks contrast. Images with desaturation and contrast work better together.

When possible zoom in on the object you want to focus on

Mood board showing a clear colour palette.

Mood board showing a general look and feel. Variety of shots, careful handling etc..

Notes:

Photographers

To ensure a uniform look across BioMar, it is vital to provide any photographer with the photo style guide outlined in this section, prior to the photo shoot.

It is recommended to plan a detailed shot list and create a mood board for the photographer which includes a wide range of different shot positions and angles. This helps to avoid re-shoots and leads to a more efficient and cost effective photo shoot.

File Management

Please ensure all ‘hero’ shots from every photo shoot must be shared globally for all markets to have easy access.

Refer to the Global Marketing Photo Library , where a filing system helps to store all shared images. for easy access globally.

All photo information should be in the photo file name - this should include, location, species, production type, personnel and date. All submitted photos should be GDPR compliant.

When sharing files across email, send a link versus very large photo files.

We aim to eliminate the need for external file storage and transfer systems. E.g Dropbox and WeTransfer.
